

FRST 304: FOREST STEWARDSHIP IN A CHANGING CLIMATE

Dr. Suzanne Simard

Rubric for photo essay of evergreen and deciduous trees in their local forest ecosystems

DUE MONDAY, MARCH 24, 2025

Please ensure your submission includes your full name and your student number.

- (1) **The scientific and common name of each tree species in your library of 6-8 species (2 marks).** For full marks, include both forms of the name. The scientific name must be written in the proper format- *Genus species* (e.g., *Pseudotsuga menziesii*). Genus is capitalized, and species is not. Both are italicized.
- (2) **At least six photos, each of a different evergreen or deciduous tree species, preferably in its natural forest ecosystem. Include the date of each photo. 8 photos, each of a different evergreen or deciduous tree species, are needed for full marks. (14 marks total)**
 - **2 marks for the photos of each tree species in their natural forest ecosystems**
 - **2 marks for the quality of the 8 photos** (e.g., with targeted tree species in focus and the forest where it is located in the background)
 - **2 marks for describing the rough location** where the 8 photos were taken.
 - **1 mark for showing identifiable feature of each of the 8 species (1 mark each)-** (e.g., feature such as the shape of the tree, its branches, leaves or bark.)
 -
- (3) **Brief observations of the local forest where you took the photo of the tree species. 300 words maximum. (8 marks)**
 - **2 marks** for commenting on the identification of the neighboring tree species
 - **2 marks** for describing how wet the site is (dry, medium, wet)
 - **2 marks** for commenting on the slope position (crest, mid or lower)
 - **2 marks** for commenting on the successional status of the forest (young, mature, old-growth)
- (4) **Brief explanation of the why these species belong in these ecosystems (i.e., what is their preferred climate, site, and how well you think they will adapt to climate change). 300 words maximum. (8 marks)**
 - **2 marks** for linking the tree to the regional climate.
 - **2 marks** for describing the kind of site (e.g., soil moisture regime, soils, slope position, elevation) where these species occur.
 - **4 marks** for describing the potential for each of the tree species to survive over the next century in these ecosystems.
